IRON DISTRICT

Website project report

Mohamed Ahmed Hussein Talaat | Student ID: 224120930

Live website: mohamedtalaat23.github.io/iron-district/

Topic & purpose

Iron District is a fictional Cairo strength gym. This static website helps visitors discover six classes, compare membership prices, view a weekly timetable and try a registration form. It uses HTML5, CSS3 and Bootstrap without a backend or custom JavaScript.

Site map

Shared navigation on every page -> Home (index.html), Classes (classes.html), Schedule & memberships (schedule.html), Join (join.html).

Every page links to all four pages through shared navigation. Home links directly to Classes and Join; class cards link to Schedule; memberships link to Join. The logo returns to Home.

Requirements checklist

Document structure

All four pages: doctype, lang, charset, viewport, description, unique title; header, nav, main, section and footer.

Article and aside

Classes uses article cards and a beginner aside; Join also uses an aside.

Text and links

Heading hierarchy and paragraphs throughout; strong and em on Home; shared page links; external ACE link on Classes.

Images, lists and video

Home gym image with alt text, benefits unordered list and local MP4 with controls; Classes ordered beginner list.

Table and merged cells

Schedule uses caption, scoped headers, rowspan for 60-minute sessions and colspan for shared mobility.

Form inputs

Join contains text, email, password, number, date, radio, checkbox, select, textarea and submit; associated labels and fieldsets.

Requirements checklist - continued

Native validation

Required fields, email syntax, 8-character demo password and age 18-100. Radios share a name and empty values; other controls omit names so personal values are never submitted.

Custom CSS

assets/style.css: element, class, attribute and descendant selectors; hover, focus-visible and target pseudo-classes; colours, backgrounds, system fonts and box model.

Layout

Header/navigation use Flexbox; memberships and split sections use Grid; hero overlays and skip link use positioning; block, flex, grid and none display values.

Responsive layout

767px media query stacks sections and wraps navigation; Bootstrap responsive columns; table scroll region prevents page overflow.

Bootstrap bonus

Local Bootstrap 5.3.3 CSS: row/col responsive grid, card, btn and form-control/form-select/form-check-input classes. No JavaScript needed.

Verification

Previous website verification checked all four pages and the former HTML report at widths of 320, 375, 390, 768, 1024 and 1440 pixels without page-wide horizontal overflow. Local links and assets resolve, IDs are unique, and HTML5 parsing reported no errors. Browser checks cover form validation, radio grouping, demo submission, keyboard navigation, timetable scrolling and video playback. Screenshots show the final website at desktop and phone widths.
